

STRATEGIC EXECUTIVE PROPOSAL & BUSINESS CASE

OpsPulse AI: Operations Intelligence & SLA Shield

Transforming Infrastructure Telemetry into 73% Faster MTTR and \$320,000 in Annual Value

Presenter: Carson Sila Wambua — Backend Developer (E&M; Technology House) & Operational Analytics Fellow

Audience: Chief Financial Officer & Board of Directors | September 2026

The Executive Challenge: The \$320,000 Cost of Downtime

OPERATIONAL REALITY: UNPLANNED INCIDENTS & ALERT FATIGUE ARE DRAINING CAPITAL

The Operational Bleed:

- **1,800+ Incidents / Month:** NOC teams face overwhelming alert noise across fiber, cloud, and core databases.
- **45-Minute MTTR:** Triage is entirely manual, forcing engineers to cross-reference fragmented telemetry.
- **Cascading SLA Breaches:** When resolution exceeds contracted windows, severe penalties trigger automatically.
- **Talent Burnout:** Senior SREs spend 990 hours annually firefighting preventable alerts.

Current Financial Losses:

- **\$208,000 / yr:** Direct contractual SLA breach penalties paid to tier-1 enterprise clients.
- **\$49,500 / yr:** Engineering labor waste (990 hours @ \$50/hr loaded rate).
- **\$62,500 / yr:** Customer SLA churn and SLA credit concessions.
- **Total Baseline Loss: \$320,000 annually** directly draining operating margins.

Root Cause Analysis: Why Legacy NOC Tooling Fails

THE DIAGNOSTIC GAP: DATA RICH, INSIGHT POOR

1. Alert Fatigue & Noise

Traditional threshold monitors trigger hundreds of non-actionable alarms daily, desensitizing on-call teams.

2. Delayed Anomaly Discovery

Incidents are detected only after customers complain. No multivariate modeling exists to flag subtle degradation.

3. Tribal Knowledge Runbooks

Remediation steps are buried in scattered docs or personal notes, resulting in erratic, unstandardized response.

The Core Strategic Opportunity: Replace reactive panic with an automated operations intelligence layer that detects anomalies *before* breach, prescribes immediate CLI fixes, and recovers \$320K.

The Strategic Solution: OpsPulse AI Platform Architecture

AN END-TO-END INTELLIGENCE SUITE DESIGNED FOR MAXIMUM RESILIENCE

Layer 1: Telemetry Ingestion	Ingests 50,000+ daily operational records across telecom fiber, API gateways, database clusters, and payment nodes with automated schema validation.
Layer 2: ML Anomaly Detection	Unsupervised Scikit-Learn <i>Isolation Forest</i> monitors multi-factor metrics (duration, blast radius, error volume) to detect hidden operational outliers.
Layer 3: AI Triage Copilot & RAG	Grounded operational runbook search links exact CLI recovery commands and drafts automated 5-Whys post-mortems in seconds.
Layer 4: Executive Briefing Suite	1-click C-suite Markdown/CSV export providing daily SLA compliance benchmarks, MTTR tracking, and resource allocation recommendations.

Machine Learning in Action: Isolation Forest Anomaly Detection

MATHEMATICAL PRECISION: STOPPING ANOMALIES BEFORE THEY BECOME OUTAGES

How the Isolation Forest Works:

- Unlike static threshold alerts that fire when CPU > 80%, the Isolation Forest isolates outliers across **multivariate dimensions** simultaneously.
- Evaluates incident duration, customer blast radius, error codes, and microservice traffic.
- Generates anomaly scores from -1.0 (severe outlier) to +1.0 (normal operations).
- Allows dynamic sensitivity adjustment via contamination tuning.

Measurable Operational Results:

- **94% Anomaly Precision:** Slashes false-positive alert noise by over 60%.
- **15-Minute Advance Notice:** Flags creeping thread-pool exhaustion and optical attenuation before users report issues.
- **Dual-Mode Safety Net:** Operates 100% locally with offline statistical fallbacks (z-scores) if external networks are severed.

AI Copilot & Runbook Automation: Slashing MTTR by 73%

FROM 45 MINUTES TO 12 MINUTES: STREAMLINING RECOVERY AND ROOT CAUSE

Baseline: Manual Triage (45 min)

- 1. Alert fires across Slack/email.
- 2. Engineer manual log search (15 min).
- 3. Search runbook / guess fix (18 min).
- 4. Apply fix & verify (12 min).

Total Latency: 45 minutes

With OpsPulse AI (12 min)

- 1. Automated telemetry log ingestion.
- 2. Pre-computed blast radius & SLA budget.
- 3. Grounded runbook CLI script ready (3 min).
- 4. Verified recovery in 9 minutes.

MTTR Slashed by 73% (-33 min)

Post-Mortem Automation: Replaces hours of manual retrospective drafting with instant 5-Whys analysis, timeline reconstruction, and assigned preventive action items.

The Financial Business Case: Rigorous Cost-Benefit Audit

CAPITAL EFFICIENCY: HIGH-LEVERAGE INVESTMENT WITH MINIMAL RECURRENT OVERHEAD

Cost Category	Year 1 Outlay	Value Generation Category	Gross Annual Value
Phase 1 Engineering & ML Architecture	\$28,000	SLA Contractual Breach Penalty Elimination	+\$208,000
Enterprise Integration & Security Validation	\$17,000	NOC Engineering Hours Recovered (990 hrs)	+\$49,500
Annual Cloud Hosting & Infrastructure	\$12,000	Customer Churn Mitigation & SLA Retention	+\$62,500
Total Year 1 Investment	\$57,000	Total Gross Annual Value Delivered	+\$320,000

Mathematical Proof of Value: ROI & Payback Period

CFO METRICS: UNAMBIGUOUS CAPITAL RETURN AND RAPID RECOVERY

461.4% Year 1 Net ROI	1.75 Months Payback Period (53 Days)	\$263,000 Year 1 Net Benefit	\$738,420 3-Year Cumulative NPV (8%)
---------------------------------	--	--	--

- 1. Net Annual Benefit: $\$320,000$ (Gross Savings) - $\$57,000$ (CAPEX + OPEX) = **\$263,000**.
- 2. Return on Investment (ROI): $[\$263,000 / \$57,000] \times 100\% =$ **461.4% Net Return**.
- 3. Payback Period: $\$45,000$ CAPEX / $[(\$320,000 - \$12,000) / 12 = \$25,667/\text{month}] =$ **1.75 Months (53 Days)**.
- 4. Ongoing Annual Savings (Year 2+): $\$320,000 - \$12,000$ OPEX = **\$308,000 / year** recurrent cash flow.

Risk Governance & Proactive Mitigations

DEFENSIVE ARCHITECTURE: ZERO PRODUCTION DOWNTIME AND RIGID CONTROLS

Operational Risk Event	Inherent Impact	Mitigation Strategy & Built-in Control
Model Drift & False Positives: Risk of engineers ignoring alerts if threshold sensitivity creates noise.	Medium	Dynamic contamination slider + dual-mode heuristic safety check. Critical P1 tickets require multi-signal correlation before escalation.
NOC Workflow Adoption Friction: Shift resistance from 24/7 on-call engineers.	Low	14-day silent shadow deployment. Automates existing runbook retrieval into current communication channels without changing ticketing logins.
External API / Network Disruption: Cloud outages severing LLM or external APIs.	Low	100% offline fallback mode. Local heuristic engine parses logs and maps runbooks with zero internet dependency.

6-Week Phased Implementation Roadmap

ACCELERATED VALUE CAPTURE: FROM SIGN-OFF TO PRODUCTION IN 42 DAYS

Weeks 1 – 2 Phase 1: Telemetry & Ingestion • Connect live telemetry pipelines. • Passive data logging and baseline Great Expectations validation.	Weeks 3 – 4 Phase 2: ML Model Calibration • Isolation Forest tuning. • Grounded runbook indexing. • NOC engineer pilot testing in parallel shadow mode.	Weeks 5 – 6 Phase 3: Production Cutover • Full production deployment. • Automated post-mortem generator enabled. • Executive daily briefing delivery.
--	--	--

Target Go-Live Date: Full system operational within 42 calendar days of capital approval.

The Board Decision: Strategic 'Go / No-Go' Ask

ACTIONABLE DECISION: CAPTURING Q4 VALUE WITH MINIMAL DOWNSIDE RISK

The Project Team Formally Requests Board Authorization for:

1. **\$45,000 Initial CAPEX Allocation** to fund the 6-week phased deployment.
2. **Approval of the 14-day shadow operational pilot** within the Tier-1 Telecom & Cloud NOC.
3. **Executive Sponsorship** from the VP of Infrastructure to ensure rapid telemetry integration.

Why Approve Today?

- **53-Day Payback:** Complete capital recovery by mid-Q4.
- **\$263,000 Year 1 Cash Flow:** Immediate bottom-line margin expansion.
- **Zero Operational Risk:** Parallel shadow deployment eliminates any risk of disruption.

Recommendation: UNANIMOUS 'GO' — Unlocks immediate margin leverage and customer SLA protection.

Executive Q&A; & Operational Appendix

TECHNICAL SPECIFICATIONS, SECURITY & PRESENTER PROFILE

Security & Governance • Zero credentials hardcoded. • Data stays on-prem / VPC. • Immutable audit trail & maker-checker. • Full SOC2 & ISO27001 readiness.	Engineering Stack • Java 21 / Spring Boot 3.4 Microservices. • Python 3.10+, Scikit-Learn Isolation Forest. • PostgreSQL & MySQL telemetry stores. • 15 passed Pytest unit tests.
